amazon-mwaa-docker-images/airflow:2.11.0-dev

Docker Compose was used to run the MWAA environment:

docker-compose -f docker-compose.yaml up

This spun up **7 containers** together:

Container	Image	Purpose
`mwaa-2110-db`	`postgres:13`	Airflow metadata database
`sqs-1`	`softwaremill/elasticmq`	Local SQS mock
`mwaa-2110-spy`	`airflow:2.11.0-dev`	Monitoring
`mwaa-2110-migratedb`	`airflow:2.11.0-dev`	DB migration (runs once)
`mwaa-2110-scheduler`	`airflow:2.11.0-dev`	Airflow scheduler
`mwaa-2110-webserver`	`airflow:2.11.0-dev`	Airflow UI on port 8081
`mwaa-2110-worker`	`airflow:2.11.0-dev`	Airflow worker

Docker (plain) was used to build the images:

docker build -t amazon-mwaa-docker-images/airflow:2.11.0-base -f Dockerfiles/Dockerfile.base .
docker build -t amazon-mwaa-docker-images/airflow:2.11.0-dev -f Dockerfiles/Dockerfile-dev .
docker build -t mwaa-local:2.11 -f Dockerfiles/Dockerfile .

Summary:

- `docker build` → created the images
- `docker-compose` → ran all the services together
- `docker push` → uploaded images to GitHub Container Registry
